

Looking over my post, I don't like ∇^+ for "larger"

or ∇^* for "smaller". They are simple ideas and should

have simple ids. Better are $\nabla^+ + \nabla^*$ (∇^+ ?)

∇ is my size indicator (a large isosceles triangle - ∇ is "this")

∇^+ big, large ∇^* ∇^+ ∇^* ∇^+ ∇^*

∇^* little, small I don't even like to have to

differentiate

"big/large" or "little/small" with a "second"

circle. The meaning is the same, so why have 2 ids?

Notes:

simple ∇ complex

∇^+ second (actually from Latin .seq, follow)

∇^* first ∇^* last ∇^+ principle (∇^+ rule)

∇^+ why ∇^* cause (∇^* factor) ∇^+ because

∇^* result ∇^+ effect
